

# BioBoost™ All-Natural Biostimulant

**Activates soil organisms and enhances plant growth.**

**Only from Gardens Alive!** This exciting, all-natural product will work wonders in your garden! BioBoost contains vitamins, enzymes and other powerful yet gentle plant growth stimulants (by-products of a unique fermentation process). Its effects on plants?

- **Roots grow more vigorously.** With the decreased soil compaction BioBoost promotes, plant roots have more access to nutrients and water, increasing crop yields.
- **Photosynthesis is enhanced.** BioBoost contains "metabolic triggers" that enhance photosynthesis, converting more sunlight energy into carbon compounds.
- **Crop harvests are earlier and bigger.** Originally developed to help farmers get the most from their field crops, BioBoost is the first in a new generation of biostimulants. Essentially, it speeds up plant metabolism.
- **Earthworms and other beneficial soil life proliferate.** Billions of soil microorganisms feed on carbon compounds released through plant roots to the surrounding soil, in turn benefiting the plant in many ways. BioBoost accelerates this symbiotic cycle.
- **Soil tilth and moisture retention improve.** Because BioBoost increases root growth and earthworm activity, new channels for air and water open in the soil. As a result, soil retains more moisture, and runoff and erosion are reduced.

Plants also reach maturity faster and require less nitrogen fertilizer. Used with Gardens Alive! fertilizers, BioBoost will maximize your garden's productivity.

## **More About BioBoost...**

Use BioBoost on vegetable gardens, flower borders, lawns, trees and shrubs and even houseplants. **Spray BioBoost on plant foliage, on the soil surface, or both.** BioBoost helps microbes produce a substance that improves soil structure, so it is especially useful in heavily cultivated soil or barren soils on new construction sites.

**Apply BioBoost at planting time and at first bloom (or midseason for non-flowering crops).** Mix the highly-concentrated liquid with water and use it sparingly at a rate of 2 teaspoons of concentrate per 1,000 sq. ft. (The dilution rate is not important as long as application rate is correct.) Dip bulbs, seeds and bare-root plant roots in a 5% solution (1oz. per 2 ½ cups of water) before planting. For houseplants, use a 1% solution (1oz. per 3 qts.) every few weeks. For convenience, you can mix BioBoost with a solution of insecticides or liquid fertilizers.
