

Turbo-Tomato!™ **Tomato Weed Barrier & Mulch**

Use this product just as you would black plastic mulch and enjoy earlier and bigger harvests of tomatoes, peppers, eggplants, melons, basil and more. Turbo-Tomato! creates an effective weed barrier, warms the soil and reflects far-red light up into the plant, affecting its phytochrome, a color sensitive protein that regulates plant growth and development.

Turbo-Tomato! can be placed onto the soil immediately before transplanting, but better results may be achieved if it's positioned several weeks prior to your target transplanting date to accelerate the warming of the soil. Just lay the mulch down to cover the entire row or planting area and cover its edges with soil to hold it in place. Cut an X large enough to allow for digging a hole and placing each transplant. After planting, return the quarters of the cut X to their original positions, covering as much of the soil as possible. Don't simply cut holes, because weeds may germinate in the exposed soil.

Turbo-Tomato! holds in moisture well, but it does not allow rain to penetrate. As you would with common black plastic mulch, either water the plants individually as needed or install a drip irrigation system under the mulch.

During the growing season, occasionally wash the surface of Turbo-Tomato! clean, as necessary, to maintain reflectance and obtain optimum results.
