

Adjustable Plant Ties (10 pack)

Instructions:

1. Remove a tie from the pack.
2. Gently position the tie behind the plant at a point where the stem is strongest.
3. Bring the ends of the tie around the stem and cross them, one over the other to begin a figure-eight pattern. This allows the relatively soft material of the tie to serve as a buffer between the support surface and the plant stem.
4. Wrap the ends of the tie around the support and finish the figure-eight pattern by inserting the pointed end of the tie through the “keyhole” in the flat end.
5. Gently pull the pointed end, ratcheting the tie’s conical teeth through the keyhole to achieve the desired tightness without injuring or choking the plant.
