

Compost Alive!® with Activator

In nature, bacteria, fungi and other microorganisms process individual organic materials, turning them into humus, or compost. Compost Alive!® with Activator contains the same kinds of naturally occurring bacteria and fungi, along with a specially selected blend of micronutrients to jump-start microbial activity. When added to organic waste materials, Compost Alive! with Activator ignites the composting process, resulting in faster finished compost for your garden.

At the same time, using Compost Alive! with Activator ensures that your compost pile will not emit the bad odors that can occur when the composting process isn't working properly. Strong smells aren't just covered up, they are actually eliminated by the bacteria and fungi in Compost Alive! with Activator.

Application Instructions

1. Start with an 8-10 in. layer of green plant matter (grass clippings, freshly pulled weeds, etc.). Fifty percent of compost material should be green matter.
2. Sprinkle Compost Alive! with Activator over the layer. For a bin measuring 3 ft. by 4 ft., use 1½ cups.
3. Repeat the first two steps until you run out of plant matter.
4. Water with a hose or can, to the point of run-off.
5. Two days later, water again to the point of run-off.
6. Aerate or turn the compost pile every two weeks until ground is frozen. If twigs or stems create air pockets within the pile, turning may not be necessary. If a bad odor develops, turn the pile to aerate and add material that is more organic.

#75797

Net Weight: 5 lbs.

(Treats approx. 37 bushels of plant matter.)
