

Cupboard Moth Trap™

Moths are found in grain based products such as flour or rice. (Moths can also invade other grains, such as bird seed.) These pests cause unhealthy situations for people, and are a nuisance when preparing food. The Cupboard Moth Trap uses visual and pheromone technology to lure, capture and reduce the infestation of moths.

How does it work?

The male moths are attracted by the insect specific pheromones (sexual attractants) and also by a visual attraction - a patented black and white pattern on the trap. Upon contact with the trap's glued surface, the moth is stuck. In this way the infestation is reduced because the female fertilization process is interrupted. The pheromone remains effective for approximately 3 months (12 weeks). If moths are still present, replace the trap. One trap is sufficient for an average size kitchen or storage room. If infestation persists, contact your local professional pest control company.

Directions

Remove one trap from the carton. Remove the cover paper from the pre-glued trap. Place the trap in the kitchen or storage room, or inside the cupboard or pantry containing grain products. Trap can be placed flat on the surface, stripes upward, or stand trap opened vertically. You can also punch a hole into the trap and hang from the ceiling or from a shelf. The Indian Meal Moth, Tobacco Moth, Almond Moth and the Mediterranean Flour Moth will fly directly into the trap. If the glue surface becomes full of moths, replace with a new trap.

You will be able to quickly establish the level of infestation and monitor for any new infestation. If heavy infestation is found, other appropriate measures can be used. Carefully remove and dispose of any product that has been infested. Discard moth filled trap and place in a trash can.

Caution These traps are very sticky. The glue may be removed from hands using most hand cleaners.
