

Enz-Rot™

Blossom End Rot Spray

Helps correct calcium-deficiencies in tomatoes as well as cucumbers, melons, and peppers.

Tomato blossom-end rot is a disorder caused by calcium deficiency. This condition is aided when too much nitrogen fertilizer is used on tomato plants. The symptoms of blossom-end rot are round, brown sunken areas on the end of the tomato fruit opposite the stem. As a fruit ripens the area turns dry and leathery. This can occur after a period of rapid growth followed by dry conditions, or in periods of heavy rain that caused calcium to leach from the soil.

Net Contents 16 fl. oz. (1 Pt.)
